                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes peptides of 4-17 amino acids which displace either the anti-CD34 monoclonal antibody designated 561, th anti-CD34 monoclonal antibody produced by the hybridoma ATCC HB-11646 (designated 9609), the anti-CD34 antibody produced by hybridoma ATCC HB-11885 (9079), or the anti-human breast cancer antibody produced by hybridoma ATCC HB-11884 (9187), from a cell surface antigen on a target cell. The peptides are useful for displacing antibodies bound to cell surfaces to release cells that have been positively selected by antibody-mediated binding to beads or other solid support. Y55107 to Y5519 represent peptides used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Short peptides useful for displacing antibodies from cell surface

peptide, and was used to test the method of the invantion. The method is a non-enzymatic method for the positive selection of one or more target cells from a heterogeneous cell suspension, by using specific peptides which effect the displacement and release of a specific target cell from a specific monoclonal antibody. The method is useful for positive selection and specific release of target human haematopoletic stem/progenitor cells bound by the monoclonal anti-CD34 antibodies and the antibody 561. The method is also useful from a patient's blood or specific release of target human breast cancer cells, bound by the conoclonal anti-Drasst cancer antibody 9187, from a patient's blood or bone marrow. Identification of peptide epitopes for antibodies which recognise cell surface determinants also allows construction of diagnostic cell based assays. The peptide mediated release is enzyme from and thus leaves the cell surface profeins inteat moreover, peptide mediated release laaves the target cell free of bound antibody or antibody fragments. The method also produces a high yield of functional carry cells and is relatively inexpensive to carry out.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Escherichia coli glucose dehydrogenase mutant region peptide sequence 2.
                                                                                                                                                                                                                                                                                                                                                              Non-enzymatic method for the positive selection of target cells from a heterogeneous cell suspension, useful for selecting human breast cancer cells from a patient's blood or bone marrow -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Caps

The invention relates to a synthetic multivalent complex for binding to a major histocompatibility complex (MHC)-peptide complex. The multivalent complex comprises a T-cell receptor (TCR) protein, preferably fused to a leucine zipper sequence from c-jun or c-fos for stabilising the TCR complex. Sequences Y56066-Y56075 represent the N-termini of alpha and beta dail genes from a range of HLA restricted TCR proteins. This sequence represents the N-terminus of the human Vbetal7 chain from an influenza matrix peptide HLA-A0201 restricted TCR, encoded by clone JM22. The multivalent TCR complexes are useful for detecting MHC-peptide complexes and delivery of therapeutic agents to target cells, in vivo. The specificity of the TCRs enables the localization of the Inposome-contained drugs to the desired target site such as a tumour or virus-infected cell. This would be useful in many situations and in patigues and therefore are not all detected by the immune system.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fusion protein; T-cell receptor; c-jun; leucine zipper motif; tumour; influenza virus matrix protein epitope; major histocompatibility complex; immune system; PCR primer; mutagenesis.
                                                                                                                                                                                                                                                                                                                                                                                  enzymes are claimed to allow highly sensitive and selective quantitative determination of glucose.
                                                                                                                                                                                                                         The present sequence represents a modified region (residues 772-778) of the Escherichia coli glucose dehydrogenase (GDH) comprising of a single residue mutation H7550, i.e. where residue 4 (representing residue 775 of GDH) is changed from H1s to Asp. The invention provides modified E. coli GDH enzymes, which are modified at residue 775, with their pyroloquinoline quinone (PQC) coenzyme. A GDH enzyme with its PQC coenzyme is known as PQCPH. The invention also provides the gene encoding the modified PQCDH enzyme. The modified PQCDH coenzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                       Note: The present sequence was not provided by the inventors but was made up using the wild-type region, representing residues 772-778 of GDH, and other relevant information provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                Modified glucose dehydrogenase - allows sensitive and selective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic multivalent receptor complexes used to detect Major Histocompatibility Complex-peptide complexes, and delivering therapeutic agents to target cells

                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           J. BIOL. Chem. 262:5999-6005(1987).

-! FUNCTION: THE REACTION CATALYZED BY TOPOISOMERASES LEADS TO THE CONVERSION OF ONE TOPOLOGICAL ISOMER OF DNA TO ANOTHER.

-! CATALYTIC ACTUTIY: APP-INDEPENDENT BREAKAGE OF SINGLE-STRANDED DNA, FOLLOWED BY PASSAGE AND REJOINING.
-! SUBDINIT: MONOMER (BY SIMILARITY).
-! MISCELLANEOUS: WHEN A TOPOISOMERASE TRANSIENTLY BREAKS A DNA BACKBONE BOND, IT SIMULTANEOUSLY FORMS A PROTEIN-DNA LINK, IN WHICH A TYGOSYL OXIGEN IN THE ENZYME IS JOINED TO A DNA PHOSPHORUS AT ONE END OF THE ENZYME SA DAMA STRAND.
-! SIMILARITY: BELONGS TO PROKARYOTIC TYPE I/III TOPOISOMERASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gap.,

           Peptides R90945-64 are derived from the factor VIII protein, esp. from a modified Factor VIII in which residues Ala322-Ser750, Leu1655-Arg1689, Lys1694-Pro1782 and Asp2170-Tyr2332 are deleted. The modified Factor VIII and derived peptides can be used to prevent the activity of inhibitors of factor VIII binding to von Willebrand factor, esp. antibodies, thus preventing or treating immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                 Blowfly; callatostatin; insect neuropeptide; Leu-callatostatin; gut motility; cockroach; insecticide; blowfly; cydiastatin; helicostatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a specifically claimed callatostatin-
like peptide which is active as an inhibitor of gut motility. The
callostatin-like peptides can be used as insecticides, particularly
against lepidopteran insects. The invention relates to novel recombinant
or isolated DNA sequences representing the Helicoverpa armigera
helicostatin gene, the DraI fragment from Calliphora vomitoria or the
Lucilia cuprina prohomone coding sequence. These sequences encode
proteins of 228, 177 and 179 amino acids respectively.
                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New callatostatin-like peptide(s) and DNA - are active as inhibitors of gut motility, used as insecticides, particularly against lepidopteran insects
                                                                                                                                                                                 ;

The sequences given in R62414-18 are neuropeptides derived from the blowfly, calliphora vomitoria. The peptides are extracted either from whole bodies or heads or C. vomitoria, or may be prepared by standard peptide synthesis. The peptides, called callatostatins, inhibit production of juvenile hormone (JH), which plays a crucial role in insect development by controlling metamorphosis, adult sexual maturity and reproduction. Callatostatin is the most powerful and inhibitor known for cockroaches, with max. inhibition at 1 nm and ED50 at 0.1 nm. The peptides can be used for insect control
                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        edety

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a specifically claimed callatostatin-
like peptide which is active as an inhibitor of gut motility. The
callostatin-like peptides can be used as insecticides, particularly
against lepidopteran insects. The invention relates to novel recombinant
or isolated DNA sequences representing the Helicoverpa armigera
helicostatin gene, the Draf fragment from Calliphora vomitoria or the
fucilia cuprina prohomone coding sequence. These sequences encode
proteins of 228, 177 and 179 amino acids respectively.
                                                                                                                                                                                     Peptide fragment of human factor 8, which neutralises the activity of the factor 8 inhibitor. Corresponds to residues 1776-1782 of factor 8 reported by 'Structure of human factor VIII' Nature Vol 312: 337-342 (1984).
                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New callatostatin-like peptide(s) and DNA - are active as inhibitors of gut motility, used as insecticides, particularly against lepidopteran insects
                                                                                                                                                                                                                                                                                                                                     ;

```
The present sequence represents a specifically claimed callatostatin-like peptide which is active as an inhibitor of gut motility. The callostatin-like peptides can be used as insecticides, particularly against lepidopteran insects. The invention relates to novel recombinant or isolated DNA sequences representing the Helicoverpa armigera helicostatin gene, the Drai fragment from Calliphora vomitoria or the Lucilia cuprina prohomone coding sequence. These sequences encode proteins of 228, 177 and 179 amino acids respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunogenic peptide having a human leukocyte antigen binding motif #1.658.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a specifically claimed example of a callatostatin peptide which is active as an inhibitor of gut motility. The callostatin peptides can be used as insecticides, particularly against lepidopteran insects. The invention relates to novel recombinant or isolated DNA sequences representing the Helicoverpa armigera helicostatin gene, the DraI fragment from calliphora vomitoria or the Lucilia cuprina prohomone coding sequence. These sequences encode proteins of 228, 177 and 179 amino acids respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        \prime callatostatin-like peptide(s) and DNA - are active as inhibitors gut motility, used as insecticides, particularly against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This sequence is a histocompatibility antigen binding peptide. The invention relates to a method for active vaccination against antiologous cells expressing transmembrane proteins comprises administering to a patient a vaccine composition comprising at least an immunogenic portion of the extracellular domain of the transmembrane protein, or a xenogenelic homolog thereof, coupled to or administered with a carrier protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  effective to break tolerance to the transmembrane protein and a pharmaceutically acceptable adjuvant. The method of the invention is used to treat a variety of cancers, especially B cell Non-Hoddkin's lymphoma (NHL) and other B cell diseases such as chronic lymphocytic leukhemia, autoimmune disorders and B-cell regulatory disorders. The methou is also useful for treating diseases and conditions where administration of antibodies to transmembrane proteins has been shown to provide
                                                                                                                      It may be prepd. by conventional liq. - or solid-phase peptide synthesis methods. It is useful for treating local pain, inflammation and swelling, rhinitis, hypotension, asthma, arthritis, diarrhoea, irritable bowel syndrome, carcinoid syndrome, angina pain, and anaphylactic or septic shock. Pharmaceutical compsns. can be made with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel compositions and methods utilizing a humoral \text{immun}_{\hat{\sigma}} response to treat B cell Non-Hodgkin's lymphoma and other diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Active vaccination; autologous cell; transmembrane protein; cancer; B cell Non Hodgkin's lymphoma; B cell disease; autoimmune disorder; chronic lymphocytic leukaemia; B-cell regulatory disorder; therapy; mouse; histocompatibility antigen
                         with D-aminoacid in 7 position, useful as bradykinin antagonists

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             having a human major histocompatibility complex (MHC) class I (also peptides can blud to a specific HLA allele (i.e. HLA-A subtypes than aller of the manned in the immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly inportant in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) crayed to prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cyctoxic T cell response, by contacting a cyctoxic T cell with the peptide e.g. to produce CTLEs x vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

therapeutic benefits, and especially where the target is also capable of transducing or receiving a signal important for cell growth or function. While therapeutic regimens using anti-CD20 concepts are potentially effective for the treatment of B cell Non-Hodgkin's lymphoma, they are passive therapies that do not directly involve the immune system of the patient. Thus, these therapies may require continued administration of the therapeutic agent for efficacy, and do not provide any long term protection against recurrence. The present invention uses a humoral immune response against CD20 found in B cells. The method does not need long term administration of the therapeutic agent, and provides long term
                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention concerns highly sensitive fluorescent probes which allow for rapid and precise characterisation of neurotensin receptor binding properties on whole cells. The probes are of formula R1-C(=X)-R in which R1 is is a fluorophore chosen from fluorescein, rhodamine, Blue fluorescent and Texas red; X is oxygen or sulphur; and R is a neurotensin-type polypeptide sequence containing the core sequence Arg-Arg-Pro-Tyr-Ile-Leu or Arg-Arg-Pro-Trp-Ile-Leu Specific sequences are given in R71745 - R71972. The R1-CX- acyl group is linked to the peptide via the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes peptides that selectivel; home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a target molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the ordan or tissue is selected from prostate, lung, skin, retina, pancreas, gnt, ovary, adrenal gland, liver, and lymph node. The peptide bind to the membrane dipeptidase (MDP). 144618 to 449066 represent sequences which are used in the exemplification of the present invention.

The probes are of formula R1-C(-X). R in which R1 is is a fluorophore chosen from fluorescein, rhodamine, Blue fluorescent and Texas red; X is oxygen or sulphur; and R is a neurotensin-type polypeptide sequence containing the core sequence Arg-Arg-Pro-Tyr-Ile-Leu or Arg-Arg-Pro-Trp-Ile-Leu or Specific sequences are given in R71745 - R7172. The R1-CX- acyl group is linked to the peptide via the N-terminus in position 1. The N-terminal amino acid may also be substd. by Lys or orn.

The present sequence represents one of the claimed peptide
                                                                                                                                                                                                                                                                                                                         /note= "N-acylated with fluorescent label. See CC below. Also this amino acid can be substituted by Lys or Orn."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New fluorescent markers for neurotensin receptors - useful for i
vitro labelling of neurotensin receptors on cell surface and to
isolate neurotensin-receptor expressing cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         45.8%; Score 22; DB 15; Length 9; 57.1%; Pred. The invention relates to a human cancer-associated polypeptide plu-1. The plu-1 polypeptide can be recombinantly expressed by standard recombinant methodology. Detection of the plu-1 nucleic acid or the polypeptide is used for the following: (i) diagnosis (including immigne) and prognosis of and determination of susceptibility to, cancer, specifically ovarian or breast cancer cells, e.g. as a vaccine, or by inducing an immune response against cancer cells, e.g. as a vaccine, or by antisense inhibition). Antigens derived from the polypeptide are used to generate activated cytotoxic T lymphocytes, or dendritic cells, for subsequent return to the patient for treatment of cancer. The polypeptide may also be used to identify inhibitors of plu-1 activity. Fragments of the polypeptide, and antibodies raised against plu-1, are useful as assay and imaging agents, also therapeutically (to induce an anti-idiotype response or where computated to cytotoxic agents). The plu-1 antigen is expressed more computated to cytotoxic agents). The plu-1 antigens spreassed more computated to cytotoxic agents. The plu-1 antigens spreassed more computated to cytotoxic agents. The plu-1 antigens sequences yield the human class I alleles B27, A2, A3 and A11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Dradykinin - horn fly (fragment)
C.Species: Haematobia irritans (horn fly)
C.Species: Haematobia irritans (horn fly)
C.Species: Haematobia irritans (horn fly)
C.Species: Ba.Oct-1996 #sequence_revision 13-Mar-1997 #text_change 13-Mar-1997
C.Accession: S65433
R.Wijffels, G.; Fitzgerald, C.; Gough, J.; Riding, G.; Elvin, C.; Kemp, D.; Willadsen, F. B.W. J. Blochen. 237, 414-423, 1996
A.Title: Cloning and characterisation of angiotensin-converting enzyme from the dipterant A.Feference number: S65431
A.Accession: S65433
A.Status: preliminary
A.Status: preliminary
A.Molecule type: protein
A.Residues: 1-9 <WIJ>
A.Note: the source is designated as Hacmatobia irritans exigua
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

Accession: S78420
S. Graack, H.R.
Submitde to the Protein Sequence Database, February 1998
A. Reference number: S78411
A. Accession: S78420
A. Molecule type: protein
A. Residues: 1-9 <GOL>
A. Note: the protein is designated as mitochondrial ribosomal protein L41
C. Keywords: mitochondrion; protein biosynthesis; ribosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

Cell Tissue Res. 276:367-379(1994).

-I-FUNCTION: MAY ACT AS A NEURORANITTER OR NEUROMODULATOR AND PLAY

A ROLE IN THE INTEGRATION OF INFORMATION WITHIN THE BRAIN. MAY BE
INVOLVED IN THE CONTROL OF VISCERAL MUSCLES DUE TO ITS ABILITY TO
BEHAVE AS POTENT INHIBITORS OF PERISTALIC MOVEMENTS. MAY ALSO
FULFILL A NEUROHORMONAL ROLE ON MUSCLES OF THE GUT AND HEART.

-I-TISSUE SPECIFICITY: BRAIN, SUBDESOPHAGEAL GANGLION, RETROCEREBRAL
COMPLEX, THORACICO-ABDOMINAL GANGLION, PERIPHERAL NEUROSECRETORY
                                                                                                                                                                                                                                                                  Eukaryota; Metazoa; Arthropoda; Tracheata; Hexapoda; Insecta;

"[Hyp3]Met-callatostatin. Identification and biological properties of a novel neuropeptide from the blowfly Calliphora vomitoria.";

J. Biol. Chem. 269:21059-21066(1994).

-!- FUNCTION: MAY ACT AS A NEUROTRANSHITER OR NEUROMODULATOR AND PLAY A ROLE IN THE INTEGRATION OF INFORMATION WITHIN THE BRAIN. MAY BE INVOLVED IN THE CONTROL OF VISCERAL MUSCLES DUE TO ITS ABILITY TO BEHAVE AS POTENT INHIBITORS OF PERISTALIC MOVEMENTS. MAY ALSO FULFILL A NEUROHORMONAL ROLE ON MUSCLES OF THE GUT AND HEART.
-!- TISSUE SPECIFICITY: NEURONS WITHIN BRAIN AND ABDOMINAL GANGLION.
-!- SIMILARITY: BELONGS TO THE ALLATOSTATIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Calliphora vomitoria (Blue blowfly).
